

MULTI-FUNCTION OBJECT HOLDER FOR SUPPORTING OBJECT TO BE SCANNED

ABSTRACT OF THE DISCLOSURE

A multi-function object holder is disposed on the scanning platform of a scanning apparatus for supporting different kinds of objects to be scanned by the scanning apparatus. The holder includes a base plate for supporting the scanned object and a cover plate for pressing and positioning the scanned object. The base plate has at least one scanning window where the scanned object is positioned, and a resting space for the accommodation of the cover plate when it is not in use. The cover plate is coupled to the base plate in all times but movable from the working position for pressing the scanned object to the resting position. After the cover plate is moved to the resting position, the scanning window can be provided for the scanning of an object that requires no pressing of the cover plate.
